Means of Direct Action**

# 1. Blocking Toilets

A personal alarm is a small device that can emit a loud siren-like sound. It is activated either by a button, or a tag that, when pulled, sets the siren off. These small, noisy and easy to use alarms can be utilized in a variety of ways beyond personal safety.

Here are a few scenarios for you to mull over:

Remember when Smash Speciesism took some helium balloons into Imperial College London? They disrupted the vivisection awards using a variety of tactics, one of them setting off personal alarms tied to helium balloons released inside the auditorium. Any room with high ceilings makes a good location for such a disruption.

Are your local fascists organizing a talk? An alarm set off and thrown in their direction might drown them out!

Need a distraction so security focuses on a certain location? Well placed personal alarms might get their attention.

A horse race near you? Alarms placed around the premises have cost these places hundreds of thousands. Just make sure you're gone before police or security arrive!

Thrown into a fur shop? Takes just a few seconds and can clear out a shop faster than our best megaphone loving mates.

Set one off and throw into the bushes outside someone's bedroom window. For extra points aim for the gutters! Maybe it's the cull director, local fash or the owner of the fur shop your campaign is targeting. If you know where they live then this is one way to make sure they can't sleep at night.

This is just for entertainment but we advise that you think about traceability when purchasing. Are you buying them with card? Are they distinctive or a mass produced model? Have you handled them with gloves, or would fingerprints be found? Go have fun with your pocket sized friend, not that we endorse you causing any trouble!

## 5. Portable Alarms

Toilets are essential infrastructure that we don't often think about. When they are busted it can be incredibly disruptive and costly.

Imagine you want to trash your own toilet, I imagine many of you have blocked your toilet before. Well what if you wanted to block your toilet again but in a way that was not fixable?

Hydraulic cement is a type of cement that sets quickly once in contact with water. People have permanently destroyed toilets with hydraulic cement using a simple method. They take nylon socks or tights and using a funnel fill them with about a fistful of hydraulic cement, something available at most hardware stores. They then tie a knot and store one or more in a plastic bag as the powder will leak through the nylon. They walk into their own toilet, not animal abusing giant McDonald's or union busting Starbucks, their own toilet. Given CCTV is so prevalent in your own home and folks don't want family to know they've ruined the loo people have been known to ditch their standard attire instead dressing in 'normal' looking clothes they got from the charity shop and will dispose of after. There's a tendency to wear hats or a wig and covid mask to stay as unidentifiable as possible.

Once in the cubicle they get the makeshift cement powder ball wet and either push it into the pipe in the toilet bowl using the toilet brush or their hand wearing a washing up glove, or no glove if you are a particularly disturbed individual. Once they've ensured its properly wedged into the pipe they leave the stall without flushing.

You're gonna end up with a huge bill now and might even need to move temporarily given the lack of usable toilets.

The toilet might be the pressure point you never thought of. We strongly advise that you only mess with your toilet and never anyone else's.

## 2. Blocking Water Mains

Be warned: this is a destructive procedure and the repairs are costly, plus if timed wrongly could upset a lot of people. This is not advice, it is a satirical writing, and you should never do it to any slaughterhouse owning scumbag.

Sooo.... We've all been there: you want to live your best off grid life,

You don't always have to carry a 6-sheet poster with you if you want to do some ad hacks. For a quick, opportunistic, and on-the-go kit that you can easily fit in your bag, you'll need:

A marker: the bigger, the better  
H60 security pin  
Tx30  
Four-way utility key

Once you've done a quick scan to make sure there's no cops or security around, you can locate the lock. The placement depends on the model, but usually you'll find it in the bottom corner or middle on the side of the ad. Once you've located the lock, take a look and see which of your tools you'll need. Often, you'll be able to just pop open the ad with one tool, but sometimes the first lock will just open a panel and you'll have to locate the keyhole. Remember, some ads open incredibly easily while others are fiddly and mechanisms can be rusty and stiff. Just take a breath and keep trying.

Now that you've opened the ad, you can pull the perspex door back as far as it'll go and start making changes to the existing ad, turn it around and use the other side, or get rid of it entirely. Brandalism has this great PDF if you want to do some further reading:

[http://brandalism.ch/wp-content/uploads/2016/12/Bus\\_Stop\\_Ad\\_Hack\\_Tutorial\\_web.pdf](http://brandalism.ch/wp-content/uploads/2016/12/Bus_Stop_Ad_Hack_Tutorial_web.pdf)  
The website 'Public Access' tells you the exact tool you need to open the advertisement screens in your city.

<http://www.publicadcampaign.com/PublicAccess/Index.html>  
You should be able to find all the tools you'll need at your local hardware store.

Good luck reclaiming public spaces from advertisers.

## 4. Advertisement Reclamation

and you tell the water company to stop supplying water (cos you already harvest enough rainwater and drink from puddles) but the water company does not care and keeps turning the water back on and charging you for the 'service'. They say things like "but how will you flush toilets without water?" And "how are you going to ensure proper sanitation in your factory?"

There is a solution to all your problems that will allow you to live off grid!

What you need:

- water mains manhole
- a large screwdriver to open the metal cover
- a stopcock key
- quick concrete, water and a bucket.

Water mains supply has a switch in front of every property. This switches (also called stopcocks) are usually underground, under a metal cover, normally in front of each house or building. When you open that metal cover you should be able to see a metered counter (This tells the water company how much you're using) and the stopcock, which will be either metal or plastic and is usually somewhat rectangular. You will need to turn off the valve by making it perpendicular to the water pipe it sits on top of. If your hand won't suffice, there are such things as "water mains shut off tools" or "stopcock keys" which you should find at hardware stores.

Once you're shut off the valve, to ensure the water supplier doesn't just turn the water back on, you mix quick concrete and water in a bucket and pour it over the whole thing, filling up the hole under the metal cover. How much concrete you will need will depend on your manhole, so you'll need to check prior!

Walk away after that. You have achieved the water off grid award. Congratulations!

Note that you're not allowed to fuck with water main switches as they are property of the water company. So only fuck with YOUR OWN stopcocks, never somebody else's, specially if they are a slaughterhouse that could no longer clean the blood and guts off of the floor or a hotel hosting a far right conference that would be unable to flush the toilets. Do not do that. It is expensive, it takes time to repair and it would not be legal!

### 3. Etching Glass

Looking for a new hobby? You've tried rock tumbling and crochet but nothing really scratches the itch? Let us tell you about glass etching!

Etching glass is a fantastic hobby where you grab glass (like a window or a cup!) and you permanently mark it with a frosty and translucent decoration. You can etch using a stencil, or you can freehand if you want!

Etching fluid is sold either as a cream or as a liquid, and it normally is made from hydrofluoric acid. For that reason, you should be incredibly careful handling it and wear all the necessary PPI, like mask and gloves! Both forms of etching materials are easy to find in hobby stores. If you end up with cream etching fluid, you can dilute it, but remember that then the frosty look will be lessened.

Now, let's get to work! Folks recommend many different tools to start your hobby, but we find that the cheapest are always the best options. Grab a shoe polish bottle with a sponge tip and make sure you clean it thoroughly, getting rid of all the paint. Once that is done, you can fill it up with your fluid (or with your diluted etching cream) and seal it shut. Put the shoe polish bottle in a little plastic bag so you avoid any leakages.

Choose a window in your house that you really don't mind getting ruined. Some companies are able to buff etching fluid off the window, but it's expensive, and sometimes the only way you can clean your own mess up is to change the window completely. You can now use a stencil you've previously cut and use a thicker, more cream-like etching fluid to dab all over it, or you could simply freehand whatever drawing or message you want to permanently mark on your window! At first, it might look like water, but after a while the glass will be frosty and beautiful, allowing you to send a message to all the neighborhood.

Please be responsible and only etch your own windows. Remember that it is permanent, so don't cover the whole windscreen of your car with it if you have an important delivery to do tomorrow!

So there you have it, if rock tumbling is just too loud and Robert next door keeps calling the council with noise complaints, consider trying glass etching!
